

HW2 Data explanation

This is a cool Tableau software data visualization for Olympic athletes. The variables are athlete name, age, country, year, closing ceremony date, sport, gold medal, silver medal, bronze medal, and total medals. This is a very interesting data set because we can compare athletes from our own country against foreign countries. We can compare their ages and years of competition within certain sports or across sports. Then we have the medal count which is indicative of their overall performance at the games. Michael Phelps is the man. He won the most gold medals out of everyone.
